Welcome to your Quarterly update

Alan Goodman

Chief Investment Officer
Schroders Personal Wealth

Welcome to this quarter's investment update, designed to give you a clear picture of how your portfolio has performed recently, what's been happening in the wider markets, and how we're positioning things for the future. Our goal is to help you feel informed, reassured, and confident in the strategy we're following together.

Global equity markets ended the year on a strong footing, with several indices hitting record or multi-year highs. For the first time in a while, markets outside the US delivered stronger full-year returns, supported by a weaker dollar and more attractive valuations. Earnings remained solid, inflation eased, and expectations of further rate cuts helped sentiment, even though year-end profit-taking slowed momentum slightly.

US equities still made gains despite political uncertainty, while Europe had a particularly strong quarter. UK markets also finished the year near multi-year highs, led by large global companies. In Asia, Japan continued its rally, and emerging markets benefited from strong demand for AI-related technology.

Bond markets were mixed: UK gilts outperformed, US Treasuries were more muted, and Japanese government bonds weakened. Precious metals, especially gold, posted strong gains, while energy lagged.

As we enter 2026, we remain broadly positive but realistic about a more nuanced backdrop. Global growth is still resilient, supported by easier financial conditions and fiscal spending, but valuations in some areas are high and inflation hasn't fully disappeared. We expect markets to reward selectivity rather than broad market rallies.

Equities remain our preferred asset class, though we're focusing on diversification, value opportunities and broadening exposure beyond the narrow areas driving recent gains. We remain cautious on government bonds, continue to favour gold as a hedge, and see selective opportunities across commodities. Overall, we believe a balanced, flexible and well-diversified approach will be essential in the year ahead.

Thank you for your continued trust. If you have any questions or would like to talk through your portfolio in more detail, please feel free to get in touch — we're always here to help.

Q4 2025 at a glance

A snapshot of market trends, portfolio performance, and what lies ahead.

Market highlights	<p>Global equities: Broad-based gains, led by non-US markets → US: +2.49% UK: +6.60% Europe: +5.82% Emerging Markets: +5.62%</p> <p>Bonds: Mixed quarter → UK gilts outperformed after the Autumn Budget and a December BoE rate cut → US Treasuries delivered muted returns → Investment-grade credit remained resilient with stable spreads</p> <p>Commodities: Precious metals led the way → Gold and silver posted strong gains amid geopolitical uncertainty → Energy lagged due to oversupply concerns</p>
Your portfolio	<p>+ 2.1% return (gross of fees) → Outperformed vs benchmark</p> <p>Top contributors:</p> <ul style="list-style-type: none">● Equity positions in the US, European value stocks and China● Strong contribution from gold● Positive returns from investment grade credit <p>Tactical moves:</p> <ul style="list-style-type: none">● Maintained a modest equity tilt● Favoured investment-grade credit over government bonds● Continued holding gold as a key diversifier
Looking ahead	<p>Global growth: Resilient, but increasingly uneven → US supported by strong household balance sheets → Europe improving → UK facing a softer outlook</p> <p>Inflation: Easing overall, but still sticky in services</p> <p>Equities outlook: Constructively positioned → Preference for diversified and value oriented strategies → Continued focus on US, Europe and broader Emerging Markets</p> <p>Bonds: → Cautious on government bonds, especially in the US → More supportive fundamentals in European credit</p> <p>Gold: Remains a strategic hedge</p>
Key risks	<ul style="list-style-type: none">● Renewed inflation pressures● Valuation and concentration risks, especially in AI linked sectors● Policy uncertainty and interest rate missteps● Geopolitical tensions● Currency volatility across major markets

Performance of asset classes and geographies

Market backdrop

Global markets posted steady gains during the fourth quarter of 2025 supported by solid earnings growth, easing inflationary pressures and expectations that major central banks, led by the US Federal Reserve (Fed), would continue to lower interest rates in 2026.

For the first time in several years, non-US equities significantly outperformed the US market for the full year. Several factors supported the break from American market dominance, including a weaker US dollar, attractive valuations outside the US and a rotation by some investors away from US technology stocks. These trends contributed to strong gains in Europe, Asia and emerging markets and highlights the benefit of globally diversified, actively managed portfolios.

Bonds

There was marked divergence across global government bond markets during the final quarter of 2025. Despite volatility, UK gilts were the notable outperformer. November's Budget was well received by markets, as the government announced a larger-than-expected fiscal headroom. The Bank of England also cut the base rate by 0.25% at its December meeting which supported bond prices.

US Treasuries delivered modest returns. Longer-term yields rose (prices fell) while shorter-term yields fell (prices fell). The Federal Reserve cut interest rates twice, once in October and again in December, bringing the federal funds rate to 3.50–3.75%. After the government reopened, delayed labour market data showed hiring demand had eased but remained stable increasing the uncertainty of future interest rate decisions.

In contrast, Japanese government bonds experienced a significant selloff, with yields rising to multi-decade highs. Sanae Takaichi became prime minister in October and later announced a 21.3-trillion-yen fiscal stimulus package. Elsewhere there was some divergence across eurozone bonds as the European Central Bank (ECB) upgraded its forecasts for growth and core inflation. Interest rates were left on hold, as expected.

Equities

Over the fourth quarter of 2025, global equity markets delivered modest but steady gains. The MSCI World Index (comprising 23 developed market countries) returned 21%, in US dollar terms, for the full year. Some year end profit taking damped momentum late in the quarter, but investor sentiment remained broadly positive. Solid earnings growth supported that optimism, along with the continued enthusiasm for companies benefitting from the capabilities of artificial intelligence (AI).

Commodities

Precious metals were the clear standout performers across the commodities complex in 2025. Gold rose by more than 60% for the year, while silver posted gains exceeding 140%. Both metals are considered "safe-haven" assets but silver's price gains were also driven by a tight supply compared to expected demand for the metal.

In contrast, energy markets underperformed. Oil prices declined steadily through the year. The weakness reflected a combination of global oversupply with expanding production from both OPEC and non-OPEC producers.

Key events

The fourth quarter of 2025 closed out a strong year for global markets, with several major equity indices reaching record or multi-year highs. A softer US dollar, easing inflation and expectations of further rate cuts supported sentiment, and for the first time in several years, non-US markets outperformed the US. Tech-heavy economies such as Korea and Taiwan led gains, while Europe and Japan also delivered strong results.

Despite this constructive backdrop, volatility picked up towards year-end as investors took profits and concerns around elevated valuations, particularly in AI-related sectors, began to surface. Bond markets were mixed: UK gilts strengthened following the Autumn Budget and a Bank of England rate cut, while US Treasuries remained subdued and Japanese government bonds sold off. Precious metals stood out, with gold and silver benefitting from geopolitical uncertainty and a weaker dollar.

Against this shifting landscape, the quarter highlighted an important truth: markets can remain strong even when underlying risks are rising, and leadership can change rapidly across regions and sectors.

Joseph Allen, Senior Investment Specialist at Schroders Personal Wealth, said:

"Q4 showed us that strong market performance doesn't always mean smooth sailing. Global equities ended the year near record highs, yet beneath the surface we saw signs of dispersion such as non US markets taking the lead, volatility rising, and investors becoming more selective as valuations crept higher.

This is why selectivity matters. When returns become concentrated in a handful of themes or sectors, it's essential to look beyond the headlines and focus on quality, valuation discipline and breadth of opportunity. Not every part of the market will move together, and being intentional about where you allocate capital can make all the difference.

Periods like this aren't a signal to step back. They're a reminder to stay thoughtful, stay active, and stay focused on the areas with the most durable long term potential."

Joseph Allen

Schroders Personal Wealth

How have we managed your portfolio during the period?

During Q4 2025, we focused on capturing equity opportunities, managing growing dispersion across markets, and maintaining a disciplined approach to risk as conditions remained supportive.

Equity markets supported by strong global momentum

Global equities ended the year strongly, with non US markets leading performance. Our equity tilt, particularly towards the US, European value stocks and China, supported returns. The SPW Global ex UK Equity Fund was a key contributor, helped by sector leading positions such as Alphabet and Eli Lilly. UK equities added in absolute terms, though gains were tempered by weaker performance from defence and growth oriented names.

Tactical asset allocation and sector positioning

We maintained a modest equity tilt backed by resilient economic data and a low perceived risk of recession. To manage valuation and concentration risks, particularly around AI driven sectors, we added selectively to value markets outside the US.

Later in the quarter, we broadened our commodity exposure as conditions improved for industrial metals and parts of the energy sector.

In currencies, we closed our euro overweight early in the quarter and shifted to an overweight in the Australian dollar versus the pound, reflecting stronger momentum in Australia compared with the UK.

Fixed income and alternatives provided diversification

Fixed income contributed positively. Short duration corporate bond funds benefitted as rates rose, while sovereign bond funds outperformed mainly through asset allocation decisions. We kept our underweight in US government bonds, as markets continued to price in rate cuts we view as premature.

Investment grade credit remained resilient, with stable spreads and supportive carry. Gold also added meaningfully, supported by central bank buying, renewed ETF demand and its role as a hedge during heightened geopolitical and policy uncertainty.

Currency positioning and risk management

We continued to adjust our currency positions to reflect global economic shifts. The rotation into the Australian dollar aligned the portfolio with areas of improving strength. Throughout the quarter, our focus remained on balancing opportunity with careful risk management across regions and asset classes.

Portfolio performance summary

Portfolio performance

The portfolio delivered a positive return of **2.1%** (before fees, in GBP) in the final quarter of 2025 and outperformed its benchmark. Markets ended the year on a constructive footing, supported by easing financial conditions and resilient global growth. The SPW Global ex UK Equity Fund was the strongest contributor, helped by sector leading positions such as Alphabet and Eli Lilly. Exposure to US equities, European value stocks and China also supported performance, while the SPW UK Equity Fund added to absolute returns but lagged its benchmark as defence names softened and growth oriented holdings underperformed.

Fixed income

Fixed income made a modest positive contribution. Both SPW corporate bond funds benefitted from their short duration positioning as rates rose, while sovereign bond funds outperformed their benchmarks due to effective asset allocation. We maintained an underweight stance in US government bonds, as markets continued to price in interest rate cuts that we believe remain premature given persistent inflation pressures.

Credit markets and currency

Credit markets remained steady, with investment grade credit contributing positively to returns. In currencies, we closed our euro overweight early in the quarter following stronger US data and rotated into an overweight position in the Australian dollar versus the pound to reflect Australia's improving macro backdrop relative to the UK.

Alternatives

Gold was a meaningful contributor to returns, supported by strong central bank demand and renewed ETF buying. It continued to act as an effective hedge in an environment of sovereign debt concerns, geopolitical tensions and policy uncertainty. Later in the quarter, we broadened our commodities exposure as the outlook improved across industrial metals and parts of the energy complex.

Outlook and beyond

As we move into 2026, the global investment landscape remains shaped by resilient growth, supportive policy settings and increasing dispersion across regions, sectors and styles.

Economic activity has continued to confound pessimistic expectations, underpinned by looser monetary policy, expansionary fiscal stimulus and still-healthy private sector balance sheets. Looking ahead, the outlook remains constructive, though increasingly nuanced, as robust growth and policy support coexist with elevated valuations and rising medium-term inflation and financial stability risks.

Global growth is expected to remain resilient through 2026, supported by easing financial conditions and ongoing fiscal support, particularly in the United States, where consumer spending continues to be underpinned by solid household balance sheets and a labour market that has cooled without weakening materially. While the Federal Reserve has begun to ease policy, resilient growth and lingering inflation risks are likely to limit the scope for aggressive rate cuts. In Europe, earlier monetary easing and fiscal expansion – most notably in Germany – are beginning to support activity, though persistent services inflation and supply constraints may constrain further accommodation.

The UK faces a more challenging medium-term outlook, with weak productivity growth and expectations for fiscal consolidation weighing on activity. In China, growth is likely to stabilise but remain structurally constrained by weak domestic demand. Across emerging markets, lower inflation and a softer US dollar provide a supportive backdrop, though outcomes are expected to remain increasingly differentiated.

One of the most prominent questions from investors entering 2026 concerns whether markets – particularly equities exposed to artificial intelligence (AI) – are in bubble territory. Valuations in parts of the market are undeniably elevated, and concentration risks have increased as a narrow set of companies has driven a large share of recent returns. However, while elements of speculative behaviour are visible, the current environment differs in important ways from past market bubbles.

Earnings growth has remained robust, balance sheets are generally stronger, and investment in new technologies is being supported by tangible cash flows rather than purely speculative financing. That said, the pace of capital expenditure, rising leverage in parts of the corporate sector and growing reliance on AI-related narratives do represent a medium-term risk, particularly if expectations for productivity gains prove too optimistic or if financial conditions tighten unexpectedly.

The balance of risks therefore remains two-sided. On the upside, continued investment in new technologies and an extended period of policy accommodation could support further earnings growth and productivity gains. On the downside, a sharp reassessment of AI-related expectations, renewed inflation pressures or policy missteps could trigger periods of heightened volatility and valuation compression, even without a broader economic downturn. Importantly, these risks reinforce the need for active management and diversification rather than a wholesale retreat from risk assets.

Our positioning reflects confidence in the durability of the global cycle, balanced by a disciplined focus on valuation, concentration risk and diversification. We remain overweight to equities supported by a low probability of recession, easing monetary policy and ongoing fiscal support. However, elevated valuations and the concentration of returns within a narrow set of AI-linked companies warrant a more selective approach. We continue to seek exposure to structural growth opportunities, while actively managing risk by favouring diversified and value-oriented equity strategies where expectations are less demanding. We maintain a modest overweight to US equities given resilient corporate earnings, while increasingly emphasising diversification into international equities, where market leadership is broader.

Continued on next page >

Outlook and beyond continued

We remain underweight to government bonds, specifically in the US, where market pricing continues to imply a scale of rate cuts that appears inconsistent with resilient growth and lingering inflation risks. In credit, we maintain a neutral stance overall, with a preference for European credit markets where fundamentals remain more supportive.

Commodities continue to play an important role in portfolio construction helping to diversify risk. Gold remains a core allocation, providing an effective hedge against policy uncertainty, inflation and geopolitical risks. We are also overweight to energy and industrial metals, where supply constraints and policy-driven demand offer upside potential. In currencies, we remain negative on the US dollar over the medium term, while favouring selective exposure to the euro and higher-quality emerging market currencies.

We begin 2026 with a cautiously optimistic view. The global economic cycle still appears resilient; however, policy uncertainty and valuation risks remain. Therefore, maintaining an actively managed, well diversified and flexible, investment approach remains essential.

What risks could I be exposed to?

Diversification risk

Diversification aims to reduce the total risks across all your portfolio. However, if one investment performs well its influence on portfolio returns could be diluted by poor performance in other investments.

Market risk

Sometimes a single event can cause the values of all investments in a particular asset class (such as property or shares) or a country (like the UK or the USA) to fall suddenly and/or significantly.

Inflation risk

The risk that the value of your investments does not keep pace with increases in the value of the things you buy and enjoy.

Liquidity risk

The risk of not being able to sell your investments as quickly as you would like or at a price you had expected.

Interest rate risk

The risk your savings or investments lose money because interest rates have moved up or down. For example, your cash deposits are in a fixed account for five years earning 1% interest, but over time interest rates in general have risen to 2.5%.

On the other hand, if you don't fix the rate, you receive and interest rates fall, you have also taken a risk.

Currency risk

If you invest in foreign assets, their value can be affected by changes in exchange rates. If the investment does well and increases in value in its local currency, it could still become a loss when changed back to sterling.

Emerging markets risk

Emerging markets' supervisory standards may not be comparable with those in developed markets and their stock markets might be less well organised and less well regulated.

Stock-specific risks

These are the risks associated with an individual investment. Diversification aims to minimise this type of risk by spreading your money across a number of investments.

Default risk

Generally associated with bonds, this is when an issuer fails to keep up with interest payments or fails to repay the amount borrowed at the end of the bond's life.

Credit risk

This is the fall in value of a bond on speculation the issuer could default on its obligations (see above).

Institutional risk

This is the risk the bank or building society holding your money fails.

Counterparty risk

The risk that the other party in a contract defaults. For example, the provider of an investment product.

Other risks include political and social unrest; limited liquidity and exchange controls; currency instability; limitations on repatriation of capital; high transaction and other investment costs; differences in accounting, auditing and financial reporting standards and potential difficulties in obtaining information about issuers and markets; and governmental intervention in the private sector, including the rights of foreign ownership.

Glossary

Term	Definition
Asset Allocation	The process of dividing investments among different asset categories, such as equities, bonds, and cash, to balance risk and reward.
Benchmark	A standard or index against which the performance of a portfolio is measured.
Bond yield	The income return on a bond, usually expressed as an annual percentage.
Corporate Bonds	Bonds issued by companies to raise capital, typically offering higher yields than government bonds but with more risk.
Diversification	A risk management strategy that mixes a wide variety of investments within a portfolio to reduce exposure to any single asset or risk.
Equities	Shares of ownership in a company, also known as stocks.
Fiscal policy	Government decisions on taxation and spending to influence the economy.
Fixed Income	Investments that provide regular income payments, such as bonds.
GDP (Gross Domestic Product)	A measure of the total economic output of a country.
High Yield Bonds	Bonds that offer higher returns due to a higher risk of default, often referred to as “junk bonds.”
Inflation	The rate at which the general level of prices for goods and services rises, eroding purchasing power.
Monetary policy	Central bank actions, such as changing interest rates, to control money supply and inflation.
Portfolio	A collection of financial investments like stocks, bonds, and cash equivalents.
Recession	A period of temporary economic decline, typically defined as two consecutive quarters of negative GDP growth.
Sovereign Bonds	Bonds issued by a national government.
Tactical Asset Allocation	A short-term investment strategy that adjusts the asset mix to take advantage of market opportunities.
Volatility	A measure of how much the price of an asset fluctuates over time.
Yield curve	A graph showing the relationship between bond yields and their maturities. A steepening curve often signals expectations of higher future interest rates.
